

23. Convert 92×10^3 km to decimeters using scientific notation.
24. Convert 5.52×10^8 g to kilograms using scientific notation.
25. Convert 8.66×10^{-9} m to millimeters using scientific notation.
26. Distinguish between precision and accuracy.
27. How can method error be minimized?
28. Why do calculators often exaggerate the precision of a final result?
29. How many significant figures does 0.050 200 mg have?
30. How many significant digits does 40.60 have?
31. Graphs often permit scientists to make _____ for times when there is no data.
32. What are two possible uses for physics equations?

<u>Speedometer reading (km/h)</u>	<u>Time for 100 km trip (h)</u>
20.0	5.00
30.0	3.33
40.0	2.50
50.0	2.00
60.0	1.67
70.0	1.43
80.0	1.25
90.0	1.11
100.0	1.00

33. Using the data above, construct a graph of the time required to make a trip of 100 km measured at various speeds.
34. What Greek letter is used to mean sum or total?
35. What must quantities have before they can be added or subtracted?
36. Given $(\text{kg/s}) \times (\text{m/s})$, what is the resulting unit?
37. The established value for the speed of light in a vacuum is 299 792 458 m/s. What is the order-of-magnitude of this number?

Problem

38. Calculate the following, expressing the answer in scientific notation with the correct number of significant figures: $(8.86 + 1.0 \times 10^{-3}) \div 3.610 \times 10^{-3}$
39. The mass of Earth is 5.98×10^{24} kg, and the mass of a single proton is 1.673×10^{-27} kg. Assuming Earth is made entirely of protons, use an order-of-magnitude calculation to estimate the number of protons that make up Earth. Then, calculate the exact number of protons and express the answer in scientific notation with the correct number of significant digits.
40. The radius of Earth is 6.37×10^6 m. The average Earth-sun distance is 1.496×10^{11} m. How many Earths would fit between Earth and the sun if they are separated by their average distance? Use an order-of-magnitude calculation to estimate this number. Then, determine an exact answer and express it in scientific notation with the correct number of significant digits.

	Trial 1	Trial 2	Trial 3	Trial 4
0.0 s	20.5°C	21.3°C	20.8°C	21.0°C
5.0 s	21.0°C	22.9°C	21.4°C	21.7°C
10.0 s	21.6°C	24.1°C	22.0°C	22.3°C
15.0 s	22.2°C	26.8°C	22.7°C	22.8°C
20.0 s	23.0°C	28.2°C	23.2°C	23.3°C

41. Four trials of a chemical reaction were completed, and the change in temperature (ΔT) was measured every five seconds. Based on the data in the table above, answer the following questions. Are there any unexpected or unusual results? Explain your answer. What is the general relationship between temperature and time? Disregarding any trial(s) with unexpected results, express this relationship in the form of a general equation.
42. Suppose a certain type of deciduous tree releases 7500 leaves on average each fall. If the average mass of each leaf is 1.7 g and a 135 000 acre forest has 206 of these trees per acre, how many kilograms of leaves are dropped on the forest floor each fall? Express the answer in scientific notation and with the correct number of significant digits.
43. The average mass of an automobile in the United States is about 1.440×10^6 g. The mass of a mosquito is 10 mg. The mass of an electron is 9.109×10^{-31} kg. Use order-of-magnitude calculations to estimate how many times more massive both a mosquito and an automobile are when compared to an electron.

14. ANS: A PTS: 1 DIF: I OBJ: 1-3.2

15. ANS: C

Solution

$$\Delta x = Av$$

Rearrange the equation to solve for A and substitute units.

$$A = \frac{\Delta x}{v} = \frac{\text{m}}{\text{m/s}} = \text{s}$$

PTS: 1 DIF: IIIA OBJ: 1-3.3

16. ANS: C

Solution

$$\text{Does } \Delta v = \frac{a}{\Delta t} ?$$

Substitute units into the right side of the equation.

$$\frac{a}{\Delta t} = \frac{\text{m/s}^2}{\text{s}} = \frac{\left(\frac{\text{m}}{\text{s}^2}\right)\left(\frac{1}{\text{s}}\right)}{\left(\text{s}\right)\left(\frac{1}{\text{s}}\right)} = \frac{\text{m}}{\text{s}^3}$$

Substituting units into both sides of the equation yields the following result:

$$\frac{\text{m}}{\text{s}} \neq \frac{\text{m}}{\text{s}^3}$$

SHORT ANSWER

18. ANS:

Answers may vary. Sample answer: Mechanics studies the interactions of large objects, while quantum mechanics studies the behavior of subatomic (or very small) particles.

PTS: 1 DIF: I OBJ: 1-1.1

19. ANS:

Answers may vary. Sample answer: to explain the most basic features of phenomena

PTS: 1 DIF: I OBJ: 1-1.3

20. ANS:

meter (m), kilogram (kg), and second (s)

PTS: 1 DIF: I OBJ: 1-2.1

21. ANS:

The basic units can be combined to form derived units for other quantities.

PTS: 1 DIF: II OBJ: 1-2.1

22. ANS:

Answers may vary. Sample answer: Only units of the proper dimension will provide a meaningful measurement. For example, you cannot measure length in units of time, such as seconds; you must use a unit of length, such as meters.

PTS: 1 DIF: I OBJ: 1-2.1

23. ANS:

$$9.2 \times 10^8 \text{ dm}$$

Solution

$$\left(92 \times 10^3 \text{ km}\right) \left(\frac{10^4 \text{ dm}}{1 \text{ km}}\right) = 92 \times 10^7 \text{ dm} = 9.2 \times 10^8 \text{ dm}$$

PTS: 1 DIF: IIIA OBJ: 1-2.2

24. ANS:

$$5.52 \times 10^5 \text{ kg}$$

Solution

$$\left(5.52 \times 10^8 \text{ g}\right) \left(\frac{1 \text{ kg}}{10^3 \text{ g}}\right) = 5.52 \times 10^5 \text{ kg}$$

PTS: 1 DIF: IIIA OBJ: 1-2.2

25. ANS:

$$8.66 \times 10^{-6} \text{ mm}$$

Solution

$$\left(8.66 \times 10^{-9} \text{ m}\right) \left(\frac{10^3 \text{ mm}}{1 \text{ m}}\right) = 8.66 \times 10^{-6} \text{ mm}$$

PTS: 1 DIF: IIIA OBJ: 1-2.2

26. ANS:

Precision is the degree of exactness or refinement of a measurement. Accuracy is the extent to which a reported measurement approaches the standard or accepted value of the quantity measured.

PTS: 1 DIF: I OBJ: 1-2.3

27. ANS:

by standardizing the method of taking measurements

PTS: 1 DIF: I OBJ: 1-2.3

36. ANS:
 kgm/s^2

PTS: 1 DIF: II OBJ: 1-3.3

37. ANS:

10^8

Solution

Since the speed of light is approximately 300 000 000 m/s, which is 3×10^8 m/s, the order-of-magnitude is 10^8 .

PTS: 1

DIF: II

OBJ: 1-3.4

PROBLEM

38. ANS:

2.45×10^3

Solution

$$\frac{(8.86 + 1.0 \times 10^{-3})}{(3.610 \times 10^{-3})} = \frac{(8.86)}{(3.610 \times 10^{-3})} = 2.45 \times 10^3$$

PTS: 1

DIF: IIIA

OBJ: 1-2.4

39. ANS:

 10^{51} protons; 3.57×10^{51} protons*Given*

$m_{Earth} = 5.98 \times 10^{24} \text{ kg}$

$m_{proton} = 1.673 \times 10^{-27} \text{ kg}$

Solution

Using an order-of-magnitude calculation, the proton number estimate is

$$\frac{(10^{24} \text{ kg})}{(10^{-27} \text{ kg/proton})} = 10^{51} \text{ protons.}$$

The exact proton number is $(5.98 \times 10^{24} \text{ kg}) \left(\frac{1 \text{ proton}}{1.673 \times 10^{-27} \text{ kg}} \right) = 3.57 \times 10^{51} \text{ protons.}$

PTS: 1

DIF: IIIB

OBJ: 1-3.4

40. ANS:
 10^4 Earths; 1.17×10^4 Earths

Given

$$R_{Earth} = 6.37 \times 10^6 \text{ m}$$

$$\text{Average Earth-sun distance} = 1.496 \times 10^{11} \text{ m}$$

$$N_{Earths} \text{ between Earth and the sun} = ?$$

Solution

$$\text{Diameter}_{Earth} = 2(R_{Earth}) = (2)(6.37 \times 10^6 \text{ m}) = 1.27 \times 10^7 \text{ m}$$

Therefore, using an order-of-magnitude calculation, the estimate for the number of Earths that would fit

$$\text{between Earth and the sun is } \frac{(10^{11} \text{ m})}{(10^7 \text{ m})} = 10^4.$$

$$\text{The exact number of Earths is } \frac{(1.496 \times 10^{11} \text{ m})}{(2)(6.37 \times 10^6 \text{ m})} = 1.17 \times 10^4.$$

PTS: 1 DIF: IIB OBJ: 1-3.4

41. ANS:
 Yes; trial 2 has a much greater ΔT over the same period of time.
 Temperature increases as time increases.

Since the table indicates a direct relationship between ΔT and Δt , the general form of the equation is

$$y = mx. \text{ If } \Delta T \text{ is graphed on the } y\text{-axis and } \Delta t \text{ is graphed on the } x\text{-axis, } m \text{ represents the slope or } \frac{\Delta T}{\Delta t}.$$

In this instance, the average of $\frac{\Delta T}{\Delta t}$ is 0.12. Therefore, the equation would be: $\Delta T = 0.12\Delta t$.

PTS: 1 DIF: IIC OBJ: 1-3.1

42. ANS:
 3.5×10^8 kg

Given

$$N_{\text{leaves / tree}} = 7500 \text{ leaves/tree}$$

$$m_{\text{leaf}} = 1.7 \text{ g/leaf}$$

$$\text{size}_{\text{forest}} = 135\,000 \text{ acres}$$

$$N_{\text{trees / acre}} = 206 \text{ trees/acre}$$

Solution

Use dimensional analysis to determine mass of leaves in grams dropped on the forest floor each autumn.

$$\begin{aligned} m_{\text{leaves dropped each fall}} &= (\text{size}_{\text{forest}})(N_{\text{trees / acre}})(N_{\text{leaves / tree}})(m_{\text{leaf}}) \\ &= (135\,000 \text{ acres})(206 \text{ trees/acre})(7500 \text{ leaves/tree})(1.7 \text{ g/leaf}) = 3.5 \times 10^{11} \text{ g} \end{aligned}$$

Convert grams of leaves to kilograms.

$$\left(3.5 \times 10^{11} \text{ g}\right) \left(\frac{1 \text{ kg}}{10^3 \text{ g}}\right) = 3.5 \times 10^8 \text{ kg}$$

PTS: 1

DIF: IIC

OBJ: 1-3.3

43. ANS:
 mosquito: 10^{25} times more massive than the electron
 auto: 10^{33} times more massive than the electron

Given

$$m_{\text{auto}} = 1.440 \times 10^6 \text{ g}$$

$$m_{\text{mosquito}} = 10 \text{ mg} = 1 \times 10^{-2} \text{ g}$$

$$m_{\text{electron}} = 9.109 \times 10^{-31} \text{ kg} = 9.109 \times 10^{-28} \text{ g}$$

Solution

After converting all masses to the same dimension (i.e., grams), order-of-magnitude calculations are:

The order-of-magnitude mass for an electron is approximately 10^{-27} g, since 9.109 is close to 10.

$$\frac{m_{\text{mosquito}}}{m_{\text{electron}}} = \frac{10^{-2} \text{ g}}{10^{-27} \text{ g}} = 10^{25}; \text{ therefore, the mosquito is } 10^{25} \text{ times more massive than the electron.}$$

$$\frac{m_{\text{auto}}}{m_{\text{electron}}} = \frac{10^6 \text{ g}}{10^{-27} \text{ g}} = 10^{33}; \text{ therefore, the auto is } 10^{33} \text{ times more massive than the electron.}$$
